Practical Ladder Logic Examples for Siemens S7-300

To illustrate the application of ladder logic in Siemens S7-300, we explore several common scenarios encountered in industrial automation.

- Basic Start/Stop Motor Control

Objective: Control a motor with start and stop buttons, incorporating a holding contact to maintain operation until stopped.

Ladder Logic Description:

- Start Button (NO contact): When pressed, energizes a relay coil.
- Stop Button (NC contact): When pressed, de-energizes the relay coil.
- Motor Coil: Represents the motor's operating state.
- Holding Contact: A contact in parallel with the start button, closing when the relay coil is energized to maintain the circuit.

Implementation Steps:

- Place a normally open contact representing the start button.
- Connect it in series with the relay coil (motor relay).
- Add a normally closed stop button in series.
- Include a parallel contact of the relay coil (holding contact) across the start button.
- Connect the motor coil as an output, activated when the relay coil is energized.

Resulting Ladder Diagram:

```

...

|---[Stop NC]---[Start NO]---(Relay Coil)---|

| | |

| +---[Relay Coil]---(Holding Contact)---|

...
```

Explanation: When the start button is pressed, the relay coil energizes, closing the holding contact and keeping the motor running until the stop button is pressed.

- Implementing a Timer Delay

Objective: Turn off a motor after a specific delay once a stop command is given.

Scenario: Use a timer to delay shutdown, preventing abrupt stops that could damage equipment.

Ladder Logic Components:

- Start/Stop Control: As above.
- Timer (TON): On-delay timer that counts for specified time.
- Output Coil: Controls the motor.

Implementation Steps:

- Use a contact to trigger the timer when the stop command is activated.

- When the timer elapses, turn off the motor.

Sample Logic:

...

|---[Stop NC]---[Start NO]---(Motor ON)---|

||

|---[Stop NC]---[Timer Done]---(Motor OFF)---|

...

Explanation: When the stop button is pressed, the timer starts counting. After 10 seconds, the timer's "done" contact opens, turning off the motor.

- Safety Interlocks with Sensors

Objective: Prevent operation unless safety conditions are met, such as door closed sensors.

Scenario: A machine should operate only if a safety door is closed.

Components:

- Sensor Input (NO or NC): Detects door status.
- Logic: Ensures machine runs only when door is closed.

Implementation:

- Use a normally closed sensor contact for the door.
- Integrate it into the control circuit so that if the door opens, the circuit breaks, stopping the motor.

Sample Logic:

...

|---[Door Closed NC]---[Start NO]---(Motor Coil)---|

...

Result: The motor can only start if the door is closed, adding a safety layer.

- Sequencing Multiple Outputs

Objective: Automate a process involving multiple steps, such as filling, capping, and labeling in a packaging line.

Approach:
